My Personal Dotfiles

To set up these config's, you will need to do a fair few things, you will need to install the requirements (links found below), set up some paths in order to automate `tmux`, these must be set up in the `~/bin/t` file, this will allow you to use `t` command in order to start new/attach to existing sessions with `fzf`.

To get normal navigation working with `fzf` `o` command, you will need to go into `~/scripts/work_paths` and change these to include paths you wish to search over *note this will be updated and changed soon.*

After installing neovim config, you will need to run `:PlugInstall` followed by `:LspInstall xyz` followed by `:TSInstall xyz` in order to install plugins and language servers in order to get correct syntax highlighting

You will need to install `pandoc` to use markdown to pdf binds within vim.

- Yabai + Skhd
- Simple-bar
- My Neovim Config
 - TMUX Integration (shared keymaps with vim)
 - TMUX + Vim shared status line
 - which key
 - Neovim build in LSP
 - Git integration
 - Markdown compilation (as seen in screenshot)
- Tmux
- Kitty Terminal
- Collection of shell scripts
 - Automate language specific vimspector files
 - Streamline tmux sessions
 - And more!
